§ 1   Introduction

I use the following scheme: 1 point is roughly AMC 10 8-14 level. 2 points is roughly AMC 10 #
15-17 level, 3 points are AMC 10 # 18-21 level, 4 points are AMC 10 # 22-23 level and 5 points
are # 24-25 level. Furthermore, 6 points are #6-8 AIME level, 7 points are # 9-11 AIME level, 8
points are #12-13 AIME level, 9 points are #14-15 AIME level, and 10 points are a hypothetical
#16-18 AIME level. 10 pointers are usually olympiad-style problems that require several major
lemmas and have very long solutions.

Most of these problems are from more obscure contests that will serve as good AIME and AMC
practice.

§ 2   Combinatorics

§ 2.1   Casework

[1✎] **Problem 1** (ARML 2014) Let A, B, and C be randomly chosen (not necessarily distinct)
integers between 0 and 4 inclusive. Pat and Chris compute the value of $A + B \cdot C$ by two different
methods. Pat follows the proper order of operations, computing $A + (B \cdot C)$. Chris ignores order of
operations, choosing instead to compute $(A + B) \cdot C$. Compute the probability that Pat and Chris
get the same answer.

[2✎] **Problem 2** (BmMT 2014) Call a positive integer top-heavy if at least half of its digits are in
the set $\{7, 8, 9\}$. How many three digit top-heavy numbers exist? (No number can have a leading
zero.)

[3✎] **Problem 3** (PuMAC 2019) Suppose Alan, Michael, Kevin, Igor, and Big Rahul are in a
running race. It is given that exactly one pair of people tie (for example, two people both get
second place), so that no other pair of people end in the same position. Each competitor has equal
skill; this means that each outcome of the race, given that exactly two people tie, is equally likely.
The probability that Big Rahul gets first place (either by himself or he ties for first) can be expressed
in the form m/n, where m, n are relatively prime, positive integers. Compute $m + n$.

[3✎] **Problem 4** (PuMAC 2019) Prinstan Trollner and Dukejukem are competing at the game show WASS. Both players spin a wheel which chooses an integer from 1 to 50 uniformly at random, and this number becomes their score. Dukejukem then flips a weighted coin that lands heads with probability 3/5. If he flips heads, he adds 1 to his score. A player wins the game if their score is higher than the other player's score. The probability Dukejukem defeats the Trollner to win WASS equals m/n where m, n are co-prime positive integers. Compute $m + n$.

[4✎] **Problem 5** (Purple Comet 2015 HS) Seven people of seven different ages are attending a meeting. The seven people leave the meeting one at a time in random order. Given that the youngest person leaves the meeting sometime before the oldest person leaves the meeting, the probability that the third, fourth, and fifth people to leave the meeting do so in order of their ages (youngest to oldest) is $\frac{m}{n}$, where m and n are relatively prime positive integers. Find $m + n$.

[5✎] **Problem 6** (AIME I 2020/5) Six cards numbered 1 through 6 are to be lined up in a row. Find the number of arrangements of these six cards where one of the cards can be removed leaving the remaining five cards in either ascending or descending order.

[5✎] **Problem 7** (AMC 12B 2017/22) Abby, Bernardo, Carl, and Debra play a game in which each of them starts with four coins. The game consists of four rounds. In each round, four balls are placed in an urn—one green, one red, and two white. The players each draw a ball at random without replacement. Whoever gets the green ball gives one coin to whoever gets the red ball. What is the probability that, at the end of the fourth round, each of the players has four coins?

[5✎] **Problem 8** (HMMT November 2013) Find the number of positive integer divisors of 12! that leave a remainder of 1 when divided by 3.

[6✎] **Problem 9** (HMMT November 2014) Consider the set of 5-tuples of positive integers at most 5. We say the tuple $(a_1, a_2, a_3, a_4, a_5)$ is perfect if for any distinct indices i, j, k, the three numbers a_i, a_j, a_k do not form an arithmetic progression (in any order). Find the number of perfect 5-tuples.

§2.1.1 PIE

Each student must take at least one of these three classes, but may take two or all three. There are 10 students taking yoga, 13 taking bridge, and 9 taking painting. There are 9 students taking at least two classes. How many students are taking all three classes?

[8✎] **Problem 12** (SLKK AIME 2020) Andy the Banana Thief is trying to hide from Sheriff Buffkin in a row of 6 distinct houses labeled 1 through 6. Andy and Sheriff Buffkin each pick a permutation of the 6 houses, chosen uniformly at random. On the nth day, with $1 \leq n \leq 6$, Andy and Sheriff Buffkin visit the nth house in their respective permutations, and Andy is caught by the Sheriff on the first day they visit the same house. For example, if Andy's permutation is $1, 3, 4, 5, 6, 2$ and Sheriff Buffkin's permutation is $3, 4, 1, 5, 6, 2$, Andy is caught on day 4. Given that Sheriff Buffkin catches Andy within 6 days and the expected number of days it takes to catch Andy can be expressed as $\frac{a}{b}$ for relatively prime positive integers a and b, find the remainder when $a + b$

is divided by 1000.

§ 2.2   Perspectives

[1✎] **Problem 13** (AIME I 2002/1) Many states use a sequence of three letters followed by a sequence of three digits as their standard license-plate pattern. Given that each three-letter three-digit arrangement is equally likely, the probability that such a license plate will contain at least one palindrome (a three-letter arrangement or a three-digit arrangement that reads the same left-to-right as it does right-to-left) is $\dfrac{m}{n}$, where m and n are relatively prime positive integers. Find $m + n$.

[1✎] **Problem 14** (PuMAC 2019) How many ways can you arrange 3 Alice's, 1 Bob, 3 Chad's, and 1 David in a line if the Alice's are all indistinguishable, the Chad's are all indistinguishable, and Bob and David want to be adjacent to each other? For example, 3, 23578, and 987620 are monotonous, but 88, 7434, and 23557 are not. How many monotonous positive integers are there?

[2✎] **Problem 17** (AIME II 2002/9) Let $\mathcal{S}$ be the set $\{1, 2, 3, \ldots, 10\}$ Let n be the number of sets of two non-empty disjoint subsets of $\mathcal{S}$. (Disjoint sets are defined as sets that have no common elements.) Find the remainder obtained when n is divided by 1000.

[2✎] **Problem 19** (AMC 10B 2020/23) Square $ABCD$ in the coordinate plane has vertices at the points $A(1, 1), B(-1, 1), C(-1, -1)$, and $D(1, -1)$. Consider the following four transformations:

✦ R, a rotation of 90° clockwise around the origin;

✦ H, a reflection across the x-axis; and

✦ V, a reflection across the y-axis.

Each of these transformations maps the squares onto itself, but the positions of the labeled vertices will change. For example, applying R and then V would send the vertex A at $(1, 1)$ to $(-1, -1)$ and would send the vertex B at $(-1, 1)$ to itself. How many sequences of 20 transformations chosen from $\{L, R, H, V\}$ will send all of the labeled vertices back to their original positions?
